14. Deep mode offers reduced distortion for very deep AM. Waveform is DC-coupled and feedback-leveled at ALC levels above -13 dBm. At ALC levels below -13 dBm, output is DC-controllable, but subject to sample-and-hold drift of 0.25 dB/second.

15. The 8360 has two unleveled modes, ALC Off and Search. In ALC Off mode, the modulator drive can be controlled from the front panel to vary quiescent RF output level. In Search mode, the instrument microprocessor momentarily closes the ALC loop to find the modulator drive setting necessary to make the quiescent RF output level equal to an entered value, then opens the ALC loop while maintaining that modulator drive setting. Neither of these modes is feedback leveled.

Nominal signal level 0 dBm, nominal output impedance 50 ohms. (BNC female, rear panel.)

Sweep output

Supplies a voltage proportional to the sweep ranging from 0 volts at start of sweep to 10 volts at end of sweep, regardless of sweep width. In CW mode, voltage is proportional to percentage of full instrument frequency range. Minimum load impedance 3 k Ω . Accuracy $\pm 0.25\%$, ± 10 mv, typical. (BNC female, rear panel.)

Stop sweep input/output

Sweep will stop when grounded externally. TTL-high while sweeping, TTL-low when 8360 stops sweeping. Damage level +5.5, -0.5 volts. (BNC female, rear panel.)

Z-Axis blanking/markers output
