

# MP1777A

## 10 GHz Jitter Analyzer

STM-16 to 64, OC-48 to 192

*For STM-64/OC-192 Jitter Evaluation*

# For STM-64/OC-192 Jitter Evaluation

The MP1777A is a measurement solution for jitter evaluation. It supports both the STM-16/32/64 and OC-48/96/192 bit rates. In addition to supporting the bit rates of 2488.32, 4976.64, and 9953.28 MHz four additional bit rates used in submarine cable systems can be added as options.

The MP1777A can evaluate jitter characteristics, including jitter tolerance, jitter transfer and output jitter, which are parameters most commonly used to evaluate digital lines.

The MX177701A Jitter Performance Test Software (bundled with MP1777A) allows the MP1777A to be controlled remotely from a controller. And when the Jitter Performance Test Software is used together with specified auxiliary measuring instruments, jitter tolerance and jitter transfer characteristics can be measured automatically.

## •Conforms to O.172 Recommendations

The MP1777A meets the STM-64/OC-192 measurement standards. It is compatible with bandwidths up to 80 MHz and jitter modulation amplitudes up to 3200 Ulp-p.

\* March, 1999 edition

## •Four Optional Series of Bit Rates

Current submarine cable systems add FEC (forward error correction) to signals to enhance quality. The MP1777A can also support two series of bit rates by adding Option 01 (2494.16, 4988.32, 9976.64 MHz), Option 02 (2666.0571, 5332.1142, 10664.2284 MHz), Option 04 (3062.3629, 6124.7259, 12249.4517 MHz) and Option 05 (3069, 6138, 12276 MHz).

## •Automatic Jitter Measurement

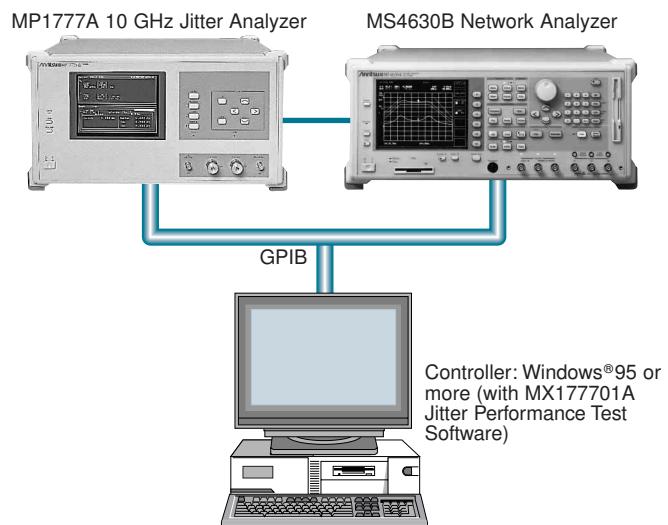

The MX177701A Jitter Performance Test Software is used for automatic jitter measurement and can be used with the MP1777A to configure an automatic measurement system for jitter tolerance and jitter transfer characteristics\*<sup>1</sup>.

\*1: Requires MS4630B Network Analyzer, MP1763B Pulse Pattern Generator and MP1764A Error Detector for automatic measurement of jitter tolerance. Requires MS4630B Network Analyzer and MP1763B Pulse Pattern Generator for automatic measurement of jitter transfer. Also requires controller, MX177701A Jitter Performance Test Software, GPIB card and cables.

## Application Examples

### •Jitter Generation

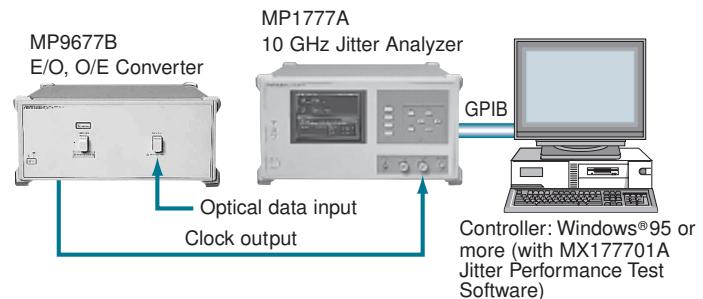

To generate jitter an external signal generator is required to source a modulation signal. The MX177701A Jitter Performance Test Software and a GPIB card are required for automatic measurement. It is also possible to perform manual measurements which does not require these items.

### •Jitter Measurement

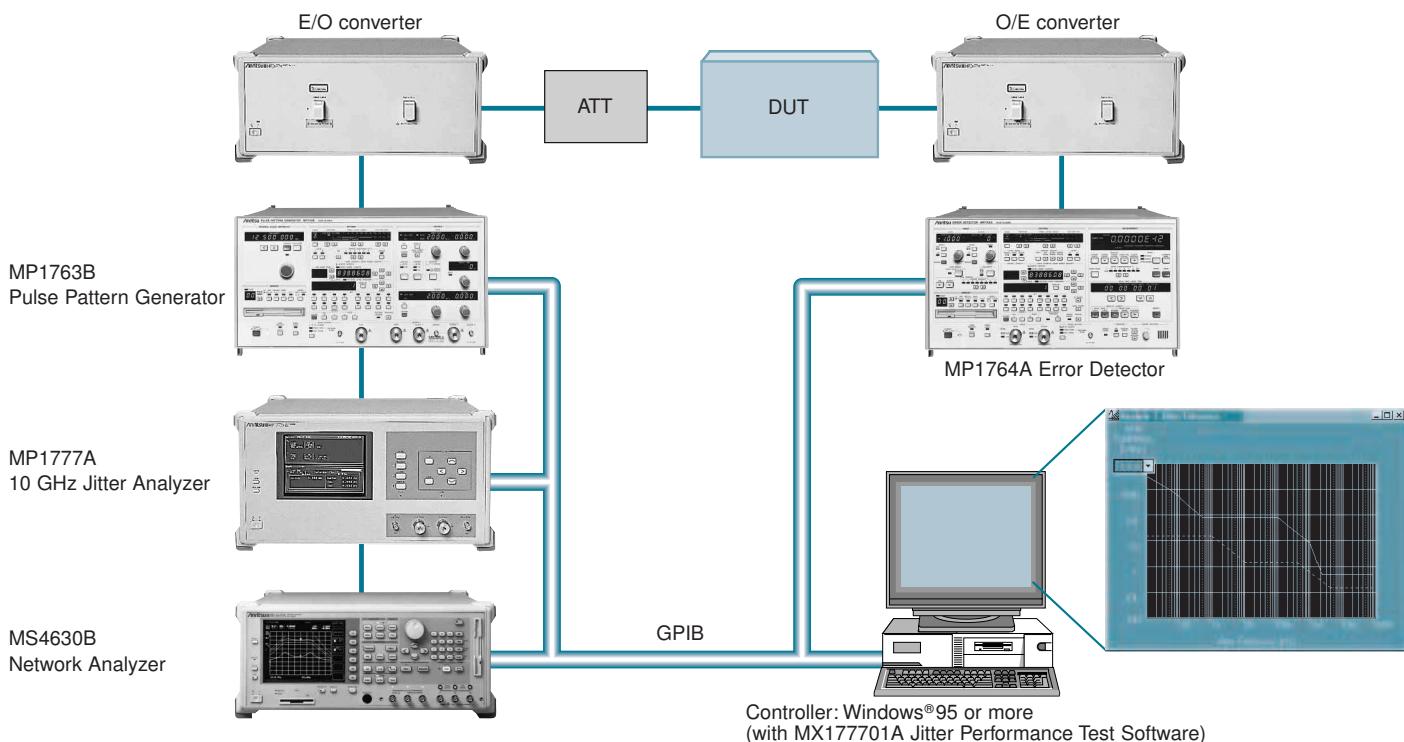

The MP1777A can measure the jitter of input signals directly without using an external BPF. When Option 10 (High Sensitive Input) is installed, it can measure the jitter of input signals with amplitudes down to 150 mVp-p. In this case, it can perform evaluation by direct device connection. The MX177701A Jitter Performance Test Software and a GPIB card are required for automatic measurement. Manual measurement is also possible and the measurement results are checked on the MP1777A screen. Furthermore, Ulp-p, UI+p, UI-p, and Ulrms can also be measured.

By combining the MP9677B E/O and O/E Converter, the MP1777A can measure the jitter measurement of optical interfaces.

## •Jitter Tolerance Measurement

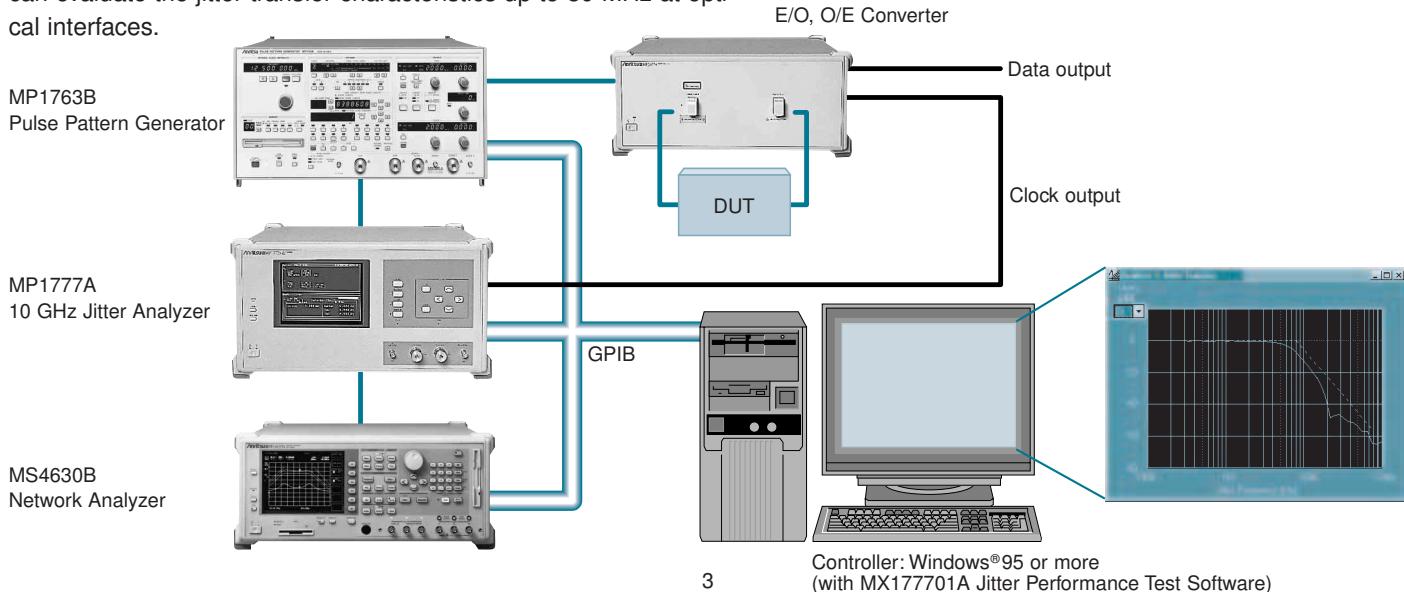

By combining the O/E and E/O converters, the MP1777A can measure the jitter tolerance of optical interfaces. The MX177701A Jitter Performance Test Software and a GPIB card are required for automatic measurement. It is also possible to perform manual measurements without these items.

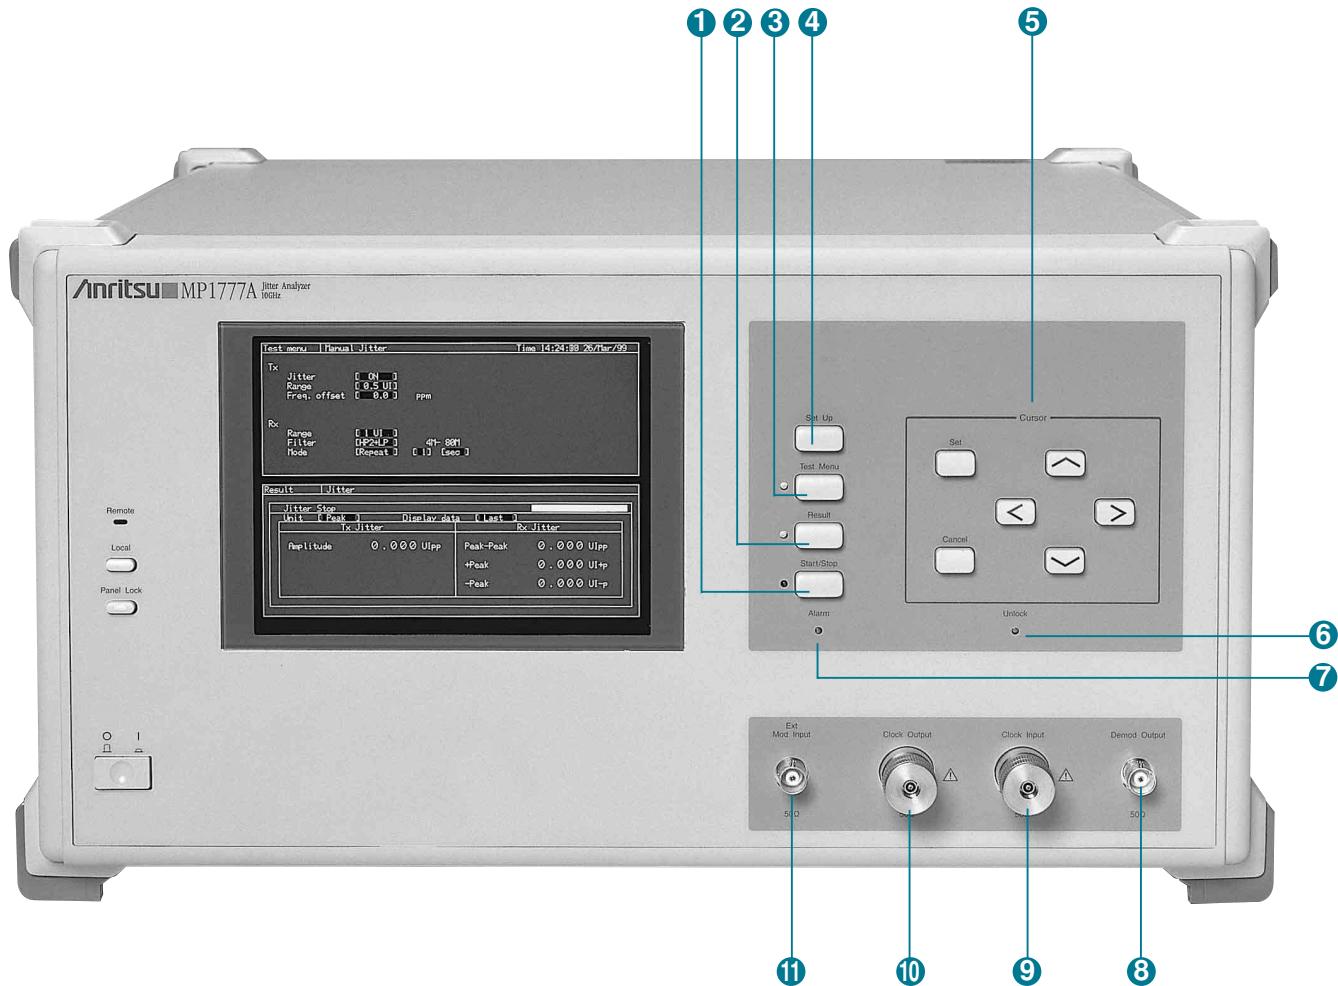

## •Measuring Jitter Transfer Characteristics

The MP1777A can evaluate jitter transfer characteristics up to 80 MHz in applications such as 10 Gbit/s clock recovery module (O/E converter) evaluation. Automatic (using MX177701A external software/GPIB) and manual measurements are possible.

By combining the MP9677B E/O and O/E Converter, the MP1777A can evaluate the jitter transfer characteristics up to 80 MHz at optical interfaces.

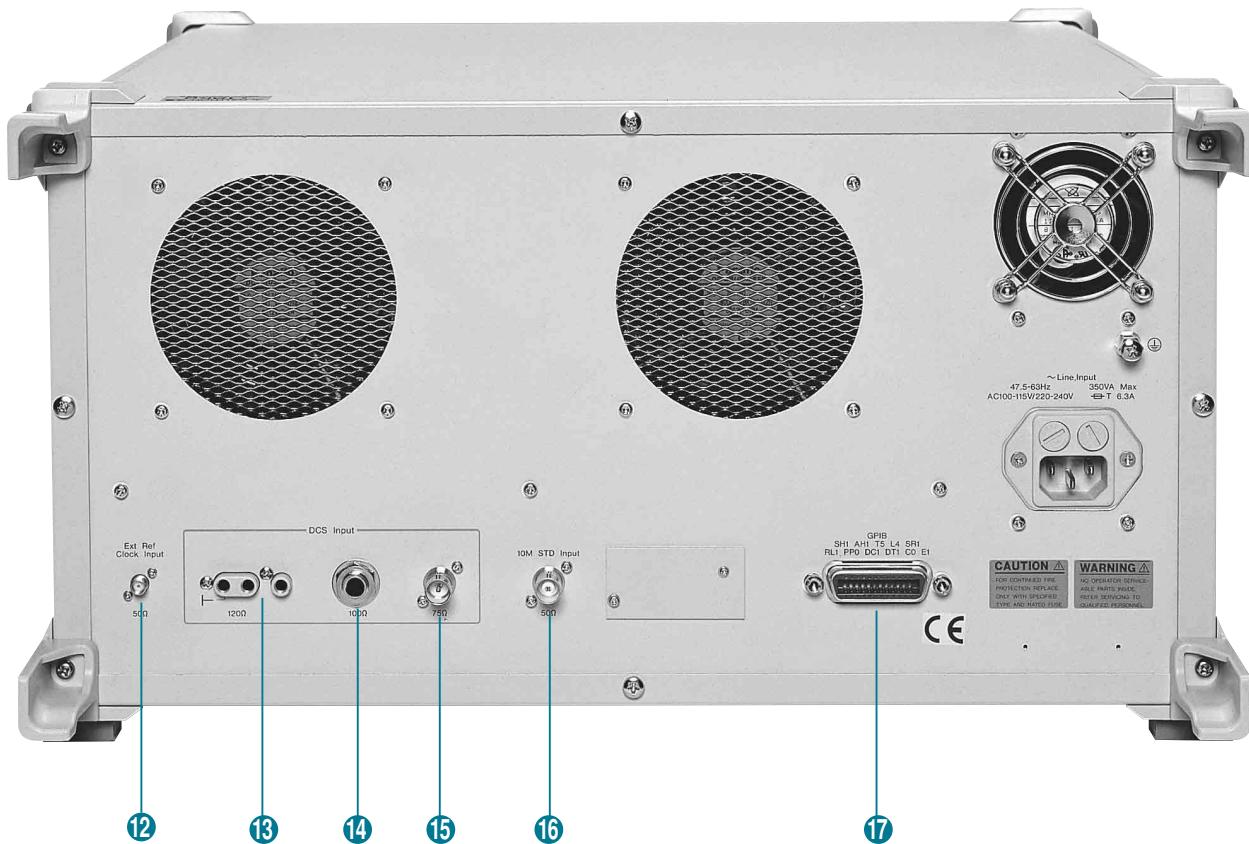

# MP1777A 10 GHz Jitter Analyzer

- 1 Start/Stop:** Used to start/stop measurement
- 2 Result:** Displays main measurement results screen
- 3 Test Menu:** Displays test menu screen
- 4 Setup:** Displays setup screen
- 5 Cursor**
- Set:** Used to set data, input numeric values, and open ASCII window
- Cancel:** Used when setting data. Also used to cancel input numeric values, and to close string windows
- <, ^, v, >: Used to move cursor on screen or window cursor. In the numeric value input window, the ^ and v keys are used to increase and decrease the numeric values, respectively.

- 6 Unlock:** Lights when jitter receiver unlocked
- 7 Alarm:** Lights when jitter transmitter unlocked
- 8 Demod. Output:** Detected jitter analog signal output, BNC connector (50 Ω)
- 9 Clock Input:** Clock input, APC 3.5 connector (50 Ω)
- 10 Clock Output:** Clock output, APC 3.5 connector (50 Ω)
- 11 Ext Mod Input:** External modulation signal input, BNC connector (50 Ω)

**12 Ext Ref Clock Input:** External reference signal input (155.52 MHz standard)

**13 DCS Input (120 Ω):** Input to synchronize with external signal. Input clock or data conforming to ITU-T G.703-10.

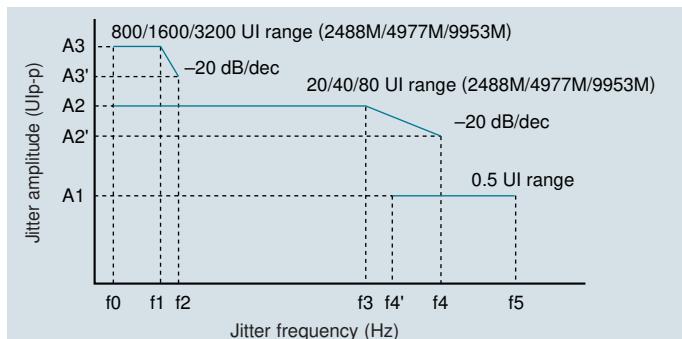

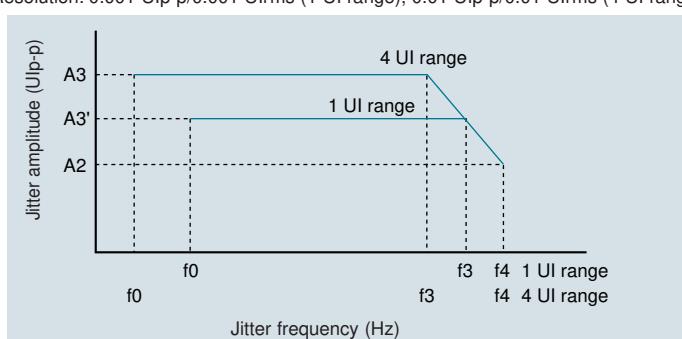

**14 DCS Input (100 Ω):** Input to synchronize with external signal. Input AMI, or B8ZS data conforming to ANSI TI.

**15 DCS Input (75 Ω):** Input to synchronize with external signal. Input clock or HDB3 data conforming to ITU-T G.703-10.

**16 10M STD Input:** Input to synchronize with external 10 MHz signal

**17 GPIB:** GPIB interface

# Specifications
