

- Down-converts 1.28 to 18 GHz signals
- Low noise floor

Specifications Summary

Sensitivity

The following graph indicates the sensitivity of the HP 3048A system as limited by its own internally-generated noise for a signal under test at +15 dBm. Also plotted is the phase noise that would limit the measurement sensitivity for a 1 GHz signal using the phase detector measurement method and the HP 8662A or HP 8663A as a reference source.

Carrier frequency range

Internal mixer: 5 MHz to 1.6 GHz, optional to 18 GHz

External (user-supplied) mixer: The frequency range of the carrier is limited only by the frequency range of the external mixer.

Offset frequency range: 0.01 Hz to 100 kHz, extended to 40 MHz with an optional spectrum analyzer such as the HP 3585B.

Amplitude accuracy: ± 2 dB to 1 MHz offsets; ± 4 dB for offsets greater than 1 MHz. This accuracy is verified by the system at the time of the measurement. If there are any accuracy degradations, the system will advise the user during the measurement.

HP 11729C Carrier Noise Test Set

The HP 11729C is a fully programmable microwave downconverter used primarily as an accessory to the HP 3048A phase noise measurement system. The input frequency range of the HP 11729C is 1.28 to 18 GHz and IF bandwidth is 5 to 1280 MHz. With option 130, the HP 11729C can be used as an AM noise demodulator for carriers from 10 MHz to 18 GHz. The baseband demodulated signal is input to the HP 3048A for calibrated AM noise measurements.
