***Comments:***

The HAKKO T31-03 Series Soldering Iron Tips are for exclusive use with the HAKKO FX-1001 Soldering Iron Handpiece. They use a highly precise manufacturing and process control method that allows for a more repeatable tip temperature between not only the same tip shape, but even between tips of different shapes but within the same series.

The construction of the tips provides similar durability to that of the HAKKO T15 Series Tips, allowing you to experience HAKKO's renowned tip life but make use of the new high-frequency induction heaters that are precisely tuned and highly responsive with excellent power output. These heaters are engineered for the lower target temperature of 350°C / 660°F, where only lower temperature soldering iron tips are required by your application's specifications.

The T31-03 Series Tips can be easily identified by the series marking that is laser etched into the end of the soldering iron tip, and the white plug at the end of the tip.
