

When 4 channels are not enough...

DLM4000 Series Mixed Signal Oscilloscope

Bulletin DLM4000-01EN

The DLM4000 is the world's first 8 channel oscilloscope providing comprehensive measurement and analysis capabilities for embedded, automotive, power and mechatronics applications.

Representing decades of experience in providing quality test and measuring tools, the DLM4000 is designed to satisfy the wide ranging needs of engineers today and in the future.

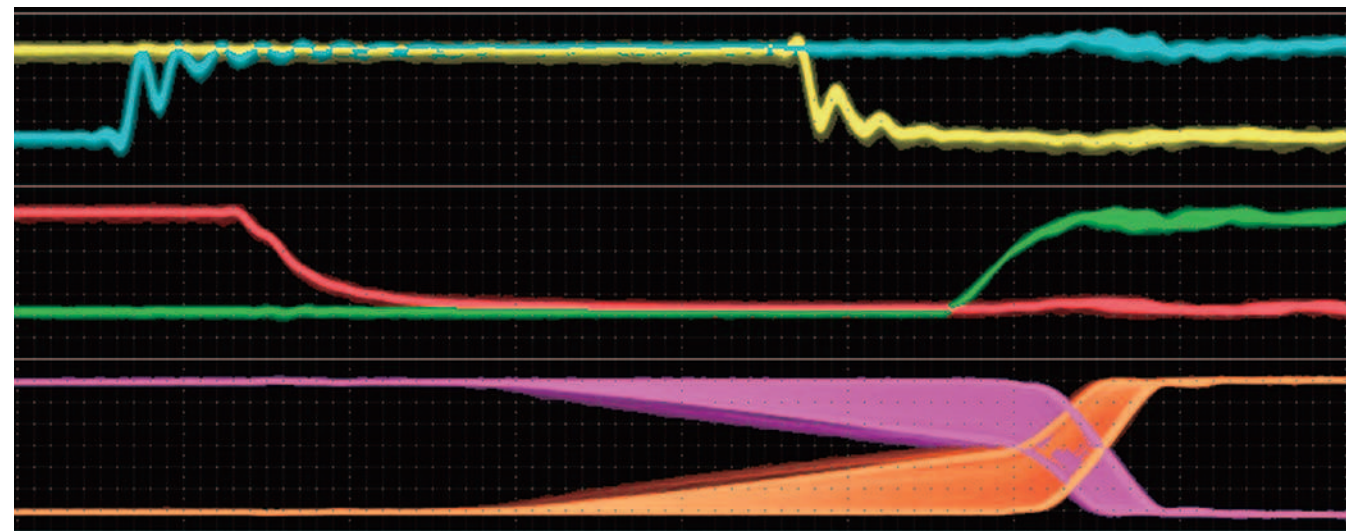

The hardware optimized architecture in the DLM4000 enables measurements and signal processing to be carried out in real time. This means that signals from multiple channels are promptly captured and measurements are always performed and updated at high speed.

The DLM4000 is:

Versatile – The number of analog and digital channels, their flexibility and the wealth of measurement and analysis features enable the DLM4000 to solve the broadest range of test requirements.

Intuitive – Via the straightforward interface, users can automatically or manually split the display to separate individual channel waveform while maintaining their full dynamic range. The details of signals can therefore be quickly analyzed irrespective of the number of channels in use.

Capable – As intelligent control permeates more and more sectors of the industry from consumer electronics to industrial drives, the signals that engineers need to look at for testing become faster and more complex. The DLM4000 delivers the features and performance that engineers need in an advanced oscilloscope.

Motor control & inverter circuit development

8ch The key to efficient and reliable high-performance electric motors is the modern inverter design, or 'Intelligent Power Module'. Multi-channel, high-speed waveform measurement is an absolute necessity. Four channels are simply not enough. Boasting eight true analog inputs, the DLM4000 empowers today's engineer with a convenient and comprehensive measurement system.

Example: 3 voltage & 3 current measurements of a 3-phase motor
Measurement of the gate-drive signals of six IGBTs within the inverter

4ch Limitation of 4 ch scope

Whole-system measurement is impossible with a four-channel scope; the real difficulty is measuring the timing between IGBT gate signals within the inverter. Voltage and current measurements between 3 phases and the IO of the motor driver IC is a very challenging test with a four-channel scope. The truly practical solution is an eight-channel MSO.

Electronic control unit & mechatronic test

8ch Numerous I/O analog, digital, and serial-bus waveforms surrounding the Electronic Control Unit (ECU) must be measured. The DLM4000 offers ample channel-count and architecture to monitor eight analog channels and up to 24-bits of logic input while simultaneously performing protocol analysis such as UART, I²C, SPI, CAN, CAN FD, LIN and FlexRay. The DLM4000 can speed up the R&D process when four channels are not enough.

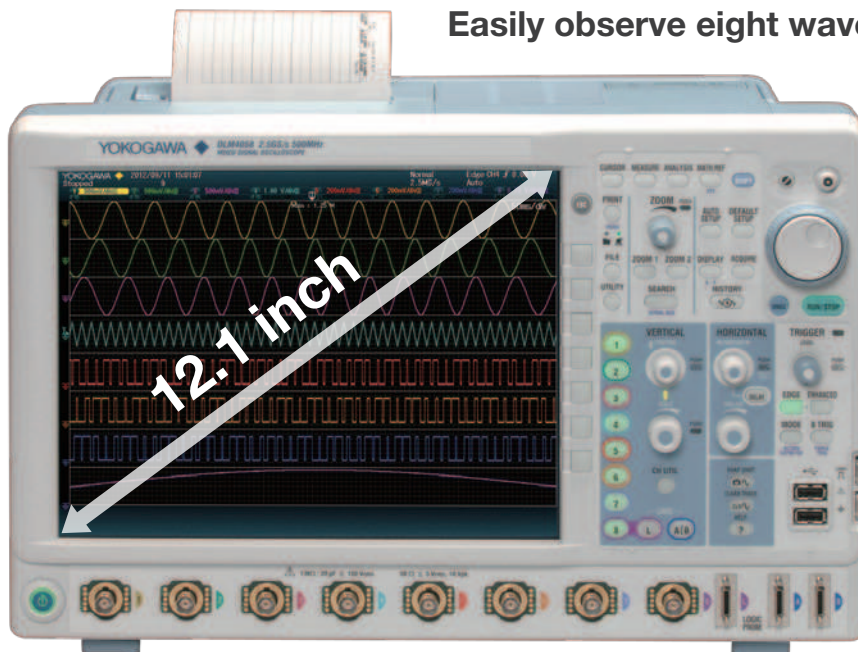

Example: Analog I/O and serial bus controller signals
Stringent real time test of digital waveforms in the analog domain.

4ch Limitation of 4 ch MSO

The additional logic inputs of a four-channel MSO mixed-signal oscilloscope provides enough channels, but this method has a blind-spot. Digital waveform analysis using logic inputs alone cannot reveal anomalies such as voltage drift, noise, distortion or ringing, and measure rise-fall times. ECU testing requires stringent examination of all digital waveforms – and analog input channels are the best tool for the job.

Long waveform memory
Up to 250 MPoints

The two advantages of a long waveform memory are the abilities to capture for long periods of time and to maintain high sample rates. Thus achieving higher effective measuring bandwidths for all time base settings.

<Basic Formula>

Measuring time = Memory length/Sample rate

With the maximum memory installed (/M3 option), in single shot mode, a 10 kHz signal lasting for more than one hour can be captured. The same memory can capture a 200 millisecond signal at a sampling rate of 1.25 GS/s.

Relationship between measuring time and sample rate in 250 Mpoint

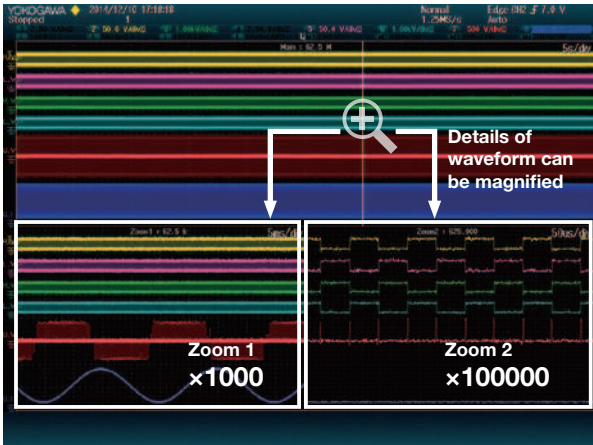

Sample rate	Maximum measuring time
1.25 GS/s	0.2 s
125 MS/s	2 s
12.5 MS/s	20 s
1.25 MS/s	200 s
125 kS/s	2000 s
62.5 kS/s	5000 s

Caution is needed when using an oscilloscope that does not have enough memory, which can cause lack of sample rate and will possibly fail to capture waveforms accurately.

Two fully independent zoom windows

Enabling two fully independent zoom windows allows users to analyze the cause and effect of abnormal behaviors over all input channels. Users can also view and compare the details and timing of different serial buses operating at different speeds.

Detailed waveform measured for 50 seconds are shown in 50 milliseconds and 500 microseconds span.

Advanced waveform search functions

Single waveform acquisitions of up to 250 MPoints can be searched using various criteria.

Waveform search using "State width"

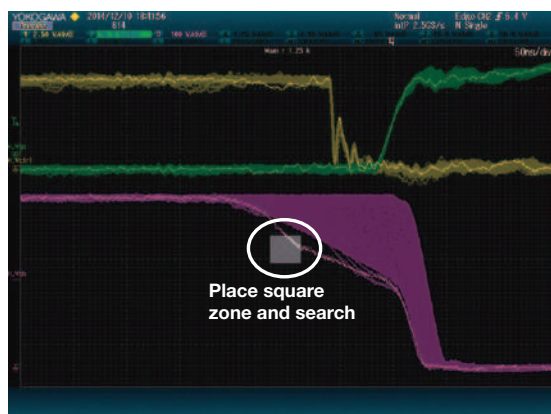

7 History function

Automatically capture and replay up to 50000 waveforms

The DLM4000 can capture and replay up to 50000 individual acquisitions (/M3 option). These can be displayed one at a time or as an accumulation. Using the search and measurement functions, abnormal signals can therefore be quickly isolated, analyzed and precisely categorized without needing to carefully configure triggers to capture rare events.

History search function

Search up to 50000 waveform history records based on detailed search parameters using the history search function.

Searching for waveforms that pass through or do not pass through a rectangular zone placed on screen.

Replay function

Automatically play back, pause, fast forward, and rewind waveform history records.

Serial bus analysis function

UART (RS232) /I²C/SPI/CAN/CAN FD/LIN/FlexRay/SENT/PSI5

Dedicated trigger and analysis options are available for various serial buses of both in-vehicle and embedded systems. A wide variety of trigger combinations can be set, including ID and Data combinations, which can also be combined with conventional edge triggers.

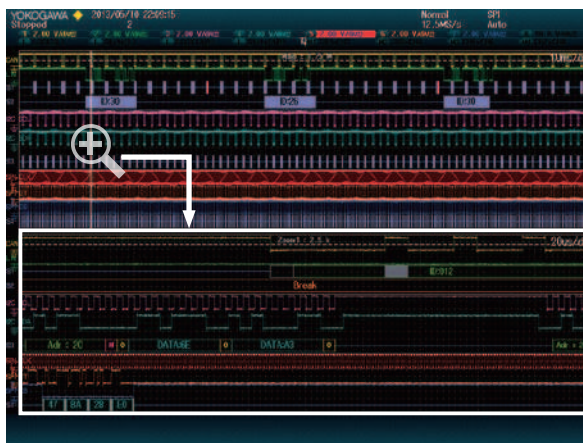

Serial bus auto-setup saves time

An intelligent serial bus auto-setup detects bit-rate and voltage threshold automatically and enables the DLM4000 to be quickly configured.

Up to 4 buses simultaneously

Analysis can be performed at high speed simultaneously on up to four different buses operating at different speeds. This is enhanced by the extensive search facilities, allowing the user to look for specific data in the very long memory. The dual-zoom facility means that different buses can be viewed and debugged alongside each other.

CAN, LIN, SPI, I²C can be viewed simultaneously by using zoom.

Reliable triggering

When just a specific event or abnormal waveform needs to be captured, the flexible and reliable triggering of the DLM4000 is the solution. In addition to basic trigger functions such as Edge, State, and Pulse Width – Advanced trigger types are provided, including Edge OR between multiple channels, Serial Bus trigger in which A combination of two bus signals is possible, or an A and B combination of different trigger types.

11 Automatic parameter measurement and statistical analysis

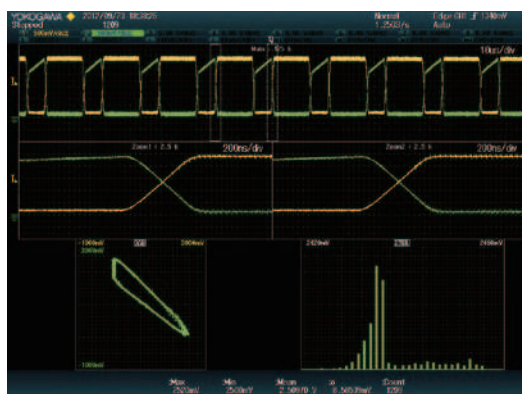

30 waveform parameters from a total of 29 different types can be displayed simultaneously with a high update rate. In addition to the basic statistical analysis of repetitively measured parameters, the Yokogawa original “cycle statistic” and “history statistic” measurement functions helps the advanced analysis of periodic mechatronic signals. To observe the fluctuations of measured parameters, it is possible to display them as trends. Period-to-period changes can then be easily seen. The variation of parameters can also be displayed as histograms thus providing a visual method of assessing them statistically.

Trend of waveform parameters

Automatic GO/NO-GO function

The GO/NO-GO function can be used to test the results of parameter measurements, trigger conditions and other criteria and automatically save or print data, send an e-mail etc. Save time using unattended supervisory data acquisition.
